This form demonstrates the use of a Wizard for filling in a PDF Form. The Wizard dialogs were built with AcroDialogs from WindJack Solutions.

For practical reasons this form is actually quite simple, but I'm sure you will quickly be able to see the different ways in which a Wizard could improve the usability of the forms you work with, and provide the users of your forms with a better form filling experience.

To get started just click on the Wizard button above.

About Form Filling Wizards:

A Wizard is a series of popup custom dialogs to guide a user through a form filling process. Wizards are a proven user interface technique used in nearly every popular software application. They simply make form filling easier for the user.

As we have all experienced, forms can sometimes be long, complex, and less than intuitive-perfect candidates for a Wizard UI. A Wizard guides users through a form filling process by breaking the form into a logical series of form sections. It can provide extra information and helpful instructions not on the form itself, display and pre-populate data culled from other parts of the form or even from outside sources. Wizards are not constrained by the same layout and print considerations that limit forms, so Wizards can present information in different and often more understandable ways than can be done on the form.
